

GyroClick

By Guy Golran, Imri Luzzattov and Rubi Mizrahi

Why GyroClick?

- Imagine coming home after a long day, when all you want to do is lay on the couch and watch some Netflix.
- You get home, turn on your PC and the TV connected to it, and crash on the couch with some Pringles by your side, ready for a night of Rick and Morty.
- Unfortunately, just when you find the perfect position, you realize that you forgot your keyboard & mouse very far (probably a few meters away).
- Sounds familiar?

Boy, do we have a
solution for you!

What is GyroClick?

- Our application uses your phone's Gyro sensor and translates every movement of your phone to a proper move of the mouse pointer on your PC!
- All you need to do is just point your phone at the element you wish to click on your PC screen.
- Plus you can use our app's keyboard if you wish to type something.

Wait, so how can
I connect my
phone to my PC?

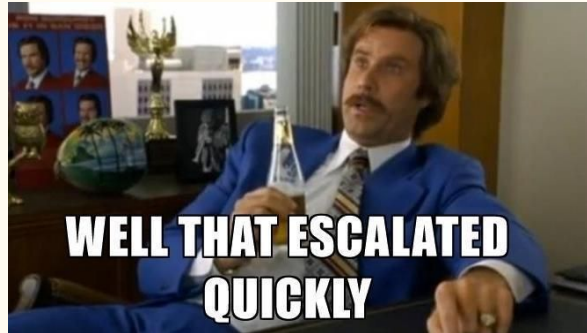

Just two simple steps and you're ready to go!

Download our computer software on you personal PC

Download and open our EXE file, which
will present a QR code on screen

Download and open our mobile application on your Android phone

- When opening the app, you'll be able to scan the QR code with your phone's camera
- Point your phone's camera at the QR code, and that's it.

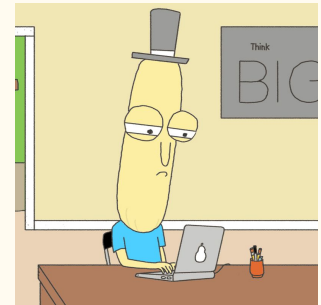

Demo time

—

Technical description

- The application uses the phone's Gyro sensor, and translates it to valid mouse pointer moves.
- After the translation, the new 'move commands' are sent to a local server on the matched computer, opened and held by the computer software, which handles the commands on the PC side.
- The connection is based on local network (i.e. the phone can connect to a computer only when both are on the same network)
- Currently connection is based on QR code scan (manual connection option to be added)
